

Sun, Moon & Stars

Grade 1 Earth Science · Unit Quiz Answer Key

1. **1. The Earth spins around, so the sun looks like it moves.**
Earth rotates, making the sun appear to move east to west.
2. **2. Look directly at the sun with your eyes.**
Never look directly at the sun; use safe observations such as shadows.
3. **3. We see different amounts of the moon's lit side as it moves around Earth.**
Moon phases show changing portions of the side lit by the sun.
4. **4. The bright sunlight makes stars too faint to see, but they're still there.**
Stars remain in the daytime sky, but sunlight outshines them.
5. **5. Air in the sky scatters blue light from the sun in all directions.**
Air scatters blue wavelengths strongly, making the daytime sky appear blue.
6. **6. Sunlight has to travel through more air near the horizon, scattering away blue light so reds and oranges remain.**
The longer path through air removes more blue light from our view.
7. **7. Summer**
A hemisphere tilted toward the sun has its longest daylight in summer.
8. **8. Earth is tilted, so different parts get more direct sunlight at different times of year.**
Earth's axial tilt changes sunlight angle and day length through the year.
9. **9. The moon is between Earth and the sun, so its dark side faces us.**
At new moon, the lit half faces mostly away from Earth.
10. **10. The moon will go from full to new and back again in about 29.5 days.**
The repeating moon-phase cycle is predictable.
